

Scratch Project Documentation

1. Project Overview

Project Title: City night

Type: Simple Story Project

Created Using: Scratch

2. Story Concept and Flow

Explain the idea behind the story and how the scenes progress.

It is a simple story created using animations available in the scratch platform which consists of a moving bird according to the pointer, changes in background effects and simple motion of a cat to understand the working of loops and get hands-on on how programmers should view solutions

3. Sprites and Backdrops Used

It uses a simple pre built theme available in the scratch platform, and color shift is used to make animated variations in the background

4. Coding Concepts Used

Mention the Scratch blocks and logic used in the project (e.g., events, loops, conditions, variables, etc.).

It uses conditions, such as when the green flag is pressed and active the actions in the screens take place.

It uses a forever loop as a looping statement to perform certain actions

It uses events such as motion to and change screen backgrounds to perform the actions in the story

5. Learnings from the Project

Through this Scratch story project, I learned how to logically plan a sequence of events and convert ideas into a working program.

I understood how event blocks control the start of actions and how motion, looks, and sound blocks help bring characters to life.

I learned the importance of timing and coordination between sprites using broadcast messages and wait blocks.

This project also improved my problem-solving skills, as I had to debug errors and adjust the code to make the story flow smoothly.

Overall, I gained confidence in basic programming concepts such as sequencing, looping, and conditional thinking.
